TITLE: The Energy Diagram of the Real Silicon Photocell 21

PERIODICAL: Fizika tverdogo tela, 1960, Vol. 2, No. 2, pp. 213-220

TEXT: A theoretical analysis of the work of a photocell is usually based on an idealized scheme, and various assumptions are made (e.g., it is assumed that the donor and acceptor concentrations in p- and n-region do not depend on the coordinates) which, in reality, are not fulfilled (hence, e.g., an impurity concentration gradient exists due to diffusion in a real photocell). In the present paper, the authors suggest a method for constructing a real energy diagram from experimental data. The plane problem in the case of equilibrium conditions is dealt with, i.e., without irradiation and without current. The necessary experimental data are obtained from measurements on the photocell itself and on the initial material from which the concentration distribution of the carriers and the position of the band edges in the cross section of the photocell are determined. The results of the general investigation are applied to two

TABLE I BOOK IDENTIFICATION 507/4164

Технологиче съоръжения по сплавов металов. 1st, Moscow, 1957
Booklet entitled "Alloys Today..." (Rare Metals and Alloys); Transactions of the
First All-Union Conference on Rare-Metal Alloys, Moscow, Metallurgizdat, 1966.
Lst p. 3, 150 copies printed.

Специализированные металлы и сплавы. Институт металлургии, ЦНИИ
металлов по редким металлам при научно-технической комиссии.
M. I. S. Saporozhny, Ed. of Publishing House: G. K. Kamyrov; Tech. Ed.:
P. D. Isakov; 1966.

Примеч.: This collection of articles is intended for metallurgical engineers,
specialists, and workers in the machine-building and radio-engineering industries.
It may also be used by the staffs of schools of higher education.

ОТРАЖ.: The collection contains technical papers which were presented and dis-
cussed at the First All-Union Conference on Rare-Metal Alloys, held in the in-
stitute of Metallurgy, Academy of Sciences of the USSR, Moscow, 1957. Results of
investigations of rare-metal alloys, titanium and zirconium alloys, alloys of
aluminum of rare metals are presented and discussed along with investigations of
titanium, vanadium, niobium, and their alloys. The effect of rare-earth metals
on properties of magnesium alloys and steels is analyzed. The uses of titanium
as a deoxidizing catalyst, electroplating of titanium, and various Al suitable for
making plugs for automobile electrical systems are discussed. Also, the ef-
fect of the addition of certain elements on the properties of heat-resistant
and corrosion-resistant alloys is discussed. So personalities are mentioned (particularly
and somewhat reference secondary source of the articles.

"The Use of Gosset's Operation in the Treatment of the Spastic Hand."

Budapest, Magyar Traumatologia, Orthopaedia es Helyreallito Sebeszet, Vol IX, No 4, 1966, pages 293-301.

Abstract: [Authors' English summary modified] Great progress has been achieved in the treatment of the spastic hand by use of the Gosset operation. The characteristic features of this intervention are the disinsertion of the flexor and pronator muscles of the spastic hand, and of the adductor and opponens muscles of the thumb. Good results were obtained by the authors in using this method; however, less satisfactory results were also observed. The intervention is recommended even when the results are less satisfactory, e.g. decrease in the degree of the spasm. 11 Eastern European, 46 Western references.

Title : On the Temperature Effect of Self-Quenching Geiger-Muller
Counters

Orig Pub : Dokl. Bolg. AN, 1958, 11, No 5, 359-362

Abstract : The temperature effect in Geiger-Muller counters is frequently related to the adsorption of discharge-quenching vapors by the material of the anode and cathode of the counter. A detailed investigation has been made of the comparative role of the adsorptions of the cathode and the anode in the temperature effect. For this purpose a study was made of the temperature effect in counters of identical constructions, in which the ability of adsorption of the cathode and anode material was artificially

increased. Results obtained indicate a strong influence of the anode adsorption. Thus, local heating of the anode by passage of direct current through it has led to a complete restoration of the initial working characteristics of the counters during cooling of the counter.

TITLE: Temperature stable regions and ageing of self-quenched G.M. counters

PERIODICAL: Referativnyy zhurnal, otdel'nyy vypusk. 32. Izmeritel'naya tekhnika, no.6, 1962, 38, abstract 32.6.231. (Dokl. Bolg. AN, 1961, 14, no.2, 135-138)

TEXT: Measurements carried out by a number of researchers with counters (C) having the same geometry and gas-filling yielded strongly divergent results; for example, the lower limit of the temperature stable region varied between -3° and $+9^{\circ}\text{C}$, and its upper limit between $+60^{\circ}$ and $+100^{\circ}\text{C}$. One of the reasons for this divergence may be the difference in the methods of degassing of the electrodes and of decontamination of the gas-filling, which determine the adsorption capacity of the walls of C. Another reason may be that C was used before the experiment for different periods

Temperature stable regions...

sociation products recombine and acquire anew quenching properties.
Further ageing of C (above 10^{16} pulses) brought about irreversible
changes. There are 7 references.
